

# WOT Box Installation Instructions

## Connector Pinout

Pin	Color	AWG	Name	Description
1	Yellow	18	RPM	Connect to Fuel Injector Drive Signal or Ignition Control Signal (varies by car model)
2	Black	18	Ground	Connect to chassis ground
3	Black	16	Power Out	Connect to ignition coil power wire going towards the ignition coils.
4	Blue	18	APP	Connect to Accelerator Pedal Position Sensor or TPS (varies by car model)
5	Green	18	Clutch	Connect to Clutch Pedal Position Switch
6	Red	16	Power In	Connect to ignition coil power wire going away from the ignition coils.

## Installation Instructions

**NOTE:** If you have a CDI (capacitive discharge ignition system) please contact us at [support@n2mb.com](mailto:support@n2mb.com) for additional instructions. Damage to your WOT Box can occur if the installation is not completed correctly! All stock ignitions are inductive, not capacitive; if you haven't installed a capacitive ignition system on your vehicle, it doesn't have one.

**WARNING:** Spark-based rev-limiters can damage catalytic converters. If you have catalytic converters on your car, N2MB accepts no responsibility for damage caused by the WOT Box. This being said, many successful installs have been made on Catalytic-Converter equipped vehicles. Damage usually is only caused by using the launch-control feature for more than a few seconds, but once again, USE AT YOUR OWN RISK IF YOU HAVE CATALYTIC CONVERTERS!

We may have detailed step-by-step pictures of this installation your car- see <http://www.n2mb.com> to find out. On our website you will also be able to download the latest version of the WOT Box software.

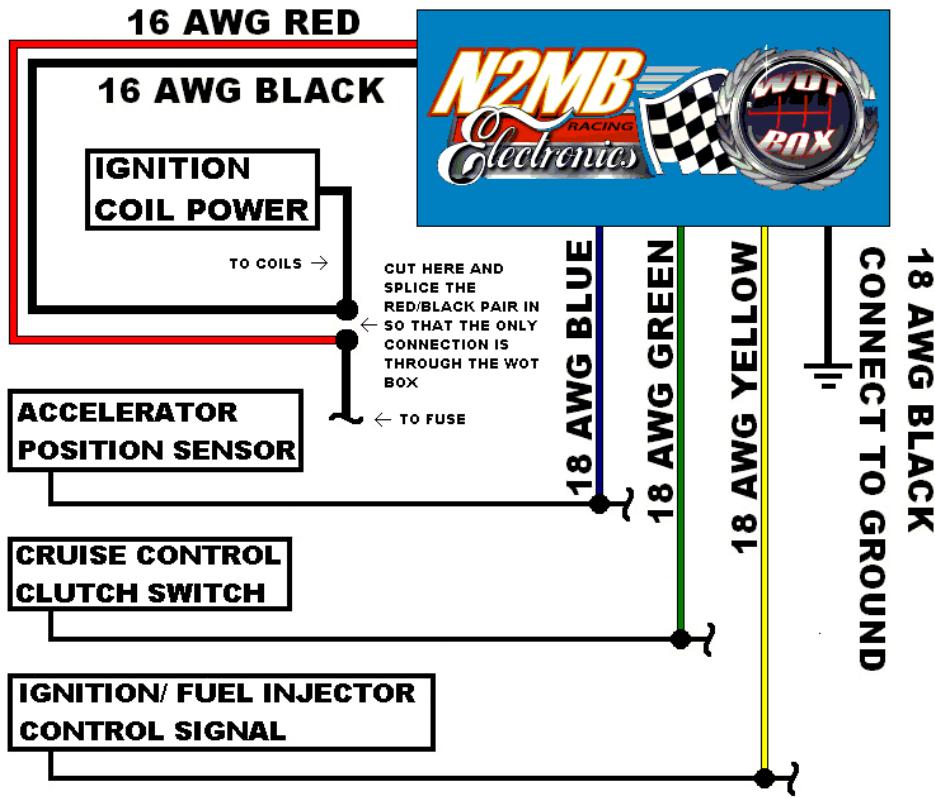

Solder all joints. The N2MB recommended soldering method is available at <http://www.n2mb.com>. Use a multimeter to verify all wires before they are cut or tapped into. The colors of wires from model year to model year may differ, and may be different on your car from those described in these instructions. Where discrepancies are known, they are described, but there may be more discrepancies than those listed. The best way to know that you have the right wire is to check the connectivity to the ECU and/or sensor at the pins described.

In these instructions, pictures include other aftermarket alterations in addition to the WOT Box. N2MB is not affiliated with these devices. In addition, if you see something that isn't in your vehicle, don't worry.

Route wires in the manner that you want them to lie permanently before connecting them. Cut wires to length before soldering; avoid coiling wires of excessive length as they can cause noise in the circuit, altering the operation of the WOT Box. Spending some extra time here will enhance the aesthetics of the install. Zip ties are included to secure the wires away from heat, moving parts, sharp edges, or anything else that can damage the wires.

The WOT Box is delivered with generic programming. Before you can use it, it must be programmed to fit your vehicle. The easiest and most versatile method of doing is with the WOT Box User Interface, available at <http://www.n2mb.com/wotboxsoftware>. However, this can also be done without a computer by the

method described at the end of this document.

**Figure I: Installation schematic**

1. Disconnect the battery negative terminal.
2. Pick out a location to mount the WOT Box. The WOT Box must be installed inside the passenger compartment since it is not waterproof. Additionally, you will want to make the WOT Box accessible to the driver, due to the fact that setting the 2-step RPM will require holding down the clutch pedal while holding the button on the WOT Box.
3. Locate a harness pass-through on the firewall accessible from the passenger compartment. Some of these are grommets that have enough room for extra wires to be passed through next to the existing harness. Some have a tightly fitting skirt that the harness passes through that does not allow for extra wires. If yours is the second, carefully poke a new hole in the skirt using a sharp object, such as a screwdriver. Be careful not to damage other wires already in the grommet, and make sure that the hole is only large enough for the red/black pair and yellow wire from the WOT box to pass through. If it is too large, water can leak in.
4. Bundle the WOT Box **18 AWG YELLOW** and **16 AWG RED / BLACK** paired wires using electrical tape. Using a coat hanger or other sharp object, pull the bundle through the grommet in the firewall.
5. Route the connector end of the wiring harness to the desired mounting point. Be careful to avoid sharp metal objects and pinch points. Leave enough of the harness in the passenger compartment to make the WOT Box easy to get to, but not an excessive amount.
6. Locate the ignition coil wiring harness, usually on the driver's side of the cylinder head, near the cam shafts. Remove some of the split loom tubing and tape to expose the wires.
7. Locate the ignition coil power wire(s). Refer to the **Table #1** below to identify the wire colors for your vehicle. If your vehicle has more than one ignition coil, either locate the splice point where the power wires

from all of the ignition coils come together at one point, or cut into all of the ignition coil power wires. Cut the wire(s) and strip both ends of the wire(s) about 5/8".

8. Split apart about 6" of the **16 AWG RED / BLACK** wire from the WOT Box. Strip the ends of the wires and slide two pieces of provided heat shrink tubing over the wires. Connect the **16 AWG RED** wire from the WOT Box to the wire(s) previously stripped that are going away from the ignition coils. Connect the **16 AWG BLACK** wire to the wire(s) previously stripped that are going towards the ignition coil(s). Solder the connection and use the provided heat shrink tubing to cover the connection. Tape up the harness with electrical tape. Recover the harness with the split loom tubing and wrap with electrical tape.
9. Locate the wire specified in **Table #2**. You may tap into this wire at the device itself or at the ECU, whichever option is more convenient for you. This wire doesn't need to be interrupted, but rather a signal read from it. Solder the **18 AWG YELLOW** wire from the WOT Box to this wire, ensuring that the original connectivity of the wire is maintained. If the original wire is cut and later rejoined to do this (preferred), use the included heat shrink tubing to seal the splice. If not, cover the solder joint with electrical tape.
10. Secure all of the under-hood WOT Box wires using the provided zip ties. Be sure to route the wires away from heat sources and sharp objects that may damage them. This completes the under-hood portion of the installation.
11. Back in the passenger compartment, locate the Accelerator Pedal Position Sensor. It is at the gas pedal. Disconnect the connector.
12. Locate the Accelerator Pedal Position Sensor #1 signal wire. Or if your car is not drive by wire, you will tap into the Throttle Position Sensor. You may tap into this wire at the accelerator pedal or throttle position sensor itself or at the ECU, whichever option is more convenient for you. Refer to **Table #3** below to identify the wire colors for your vehicle. Once again, this wire doesn't need to be interrupted, but merely "tapped into." Solder the **18 AWG BLUE** wire from the WOT Box to this wire, ensuring the original connectivity of the wire. If the original wire is cut and later rejoined to do this (preferred), use the included heat shrink tubing to seal the splice. If not, cover the solder joint with electrical tape.
13. Locate the Clutch Pedal Position Switch. Disconnect the connector to make the harness easier to access.
14. Locate the Clutch Pedal Position Switch signal wire. Refer to **Table #4** below to identify the wire colors for your vehicle. You may tap into this wire at the Clutch Pedal Position switch itself or at the ECU, whichever option is more convenient for you. Refer to the table below to identify the wire colors for your vehicle. Once again, this wire will keep its original connections, and simply gain a new one. Solder the **18 AWG GREEN** wire from the WOT Box to the Clutch Pedal Position Switch (CPP) wire. If the original wire is cut and later rejoined to do this (preferred), use the included heat shrink tubing to seal the splice. If not, cover the solder joint with electrical tape. Reconnect the CPP connector.
15. Locate a good chassis ground point near where you plan on installing the WOT Box. Try to keep the wire run as short as possible. It should be under 2' away, if possible. Next, cut the **18 AWG BLACK** wire from the WOT Box to length. Strip the wire and solidly crimp on the provided ground lug connection. Solder the ground wire to the ground lug. Connect this ground lug to the chassis. Make sure the metal where you attach the ground lug is clean, unpainted and free of rust. Use sand paper to prepare the surface, if needed.
16. Connect the WOT Box to the harness and tuck the WOT Box into the fuse panel. Re-install the battery and all the plastic trim that was removed during the installation. The installation is complete. Proceed to the testing section below.

**Table #1: WOT Box RED / BLACK Paired Wire Connection**

Car Model	Year	Wire Color	Pin # at Coil	Note
Audi B5 A4	94-97	BLACK / BLUE		See Vehicle Specific Instructions

## Programming

If your WOT Box was shipped directly from N2MB Racing, it will come set up for your vehicle. If you order a WOT Box from a distributor, it may need to be set to your vehicle before it can be used by using the WOT Box User Interface available at [www.n2mb.com/wotboxsoftware](http://www.n2mb.com/wotboxsoftware). Perform troubleshooting as outlined below first, and if the WOT Box doesn't work, use the WOT Box Software to check to make sure that the settings are correct for your vehicle. Instructions regarding how to do this are on the same website as the software. The user interface may also be used to set WOT Shift kill time and 2-step RPM.

The WOT Box comes preset for an automatic WOT Shift kill time. This means that the WOT Box will automatically adjust the kill time to your shift time, up to a maximum of 350 ms. The User Interface may be used to change this to a preset kill time that doesn't auto-adjust.

The WOT Box comes preset for a 2-step RPM of 4000. The User Interface may be used to change this RPM setpoint.

## Troubleshooting - Testing the WOT Box

1. Key on the car but do not start the engine. Press the gas pedal to the floor. You should see the LED on the WOT Box start to rapidly blink. If it does not, check your **APP sensor signal connection (WOT Box BLUE wire)**.
2. Next, with the gas pedal still depressed, press the clutch pedal to the floor. You should see the LED on the WOT Box briefly go out, and then come back on solid for one second and then finally resume blinking rapidly. If you do not see this, check your **Clutch Pedal Position Switch signal connection (WOT Box GREEN wire)**.
3. Next, start the engine. Quickly press the gas pedal to the floor and immediately step on the clutch. You should hear the engine start to rev up, stumble for a short period while the ignition is cut, then return back

on and continue revving. Remove your foot from the gas before you hit the rev limiter. The 2-step will not engage if the gas is depressed before the clutch. This is normal. If the engine does not stumble or pause when the LED turns out, then check the **RED/BLACK** paired wire. Verify that the **RED and BLACK 16 AWG** wires are wired facing the proper way. If they are reversed, the ignition cut will not work.

4. Lastly, test the 2-Step. Press the clutch pedal down and then quickly press the gas pedal all the way down. The gas pedal must be floored for the 2-step to engage. The engine should rev up to the desired RPM and hold. If it does not, be sure to remove your foot from the gas before you hit the rev limiter. If the 2-step does not work, check the **WOT Box YELLOW wire**.
5. The WOT Box Graphical User Interface has some inherent troubleshooting capability. If you have access to a laptop, it may be useful for you to download the GUI at [www.n2mb.com/wotboxsoftware](http://www.n2mb.com/wotboxsoftware) and follow the instructions there.

## Usage

To use the WOT Shift feature, keep your foot fully on the gas and shift quickly using the clutch. Keep the gas fully depressed through the shift. The WOT Box will detect the clutch switch signal and briefly cut the ignition to enable an effortless shift.

To use the 2-Step feature, fully depress the clutch. Next, fully depress the gas pedal to the floor. The engine will rev up and hold the RPM that you have set. Quickly release the clutch while leaving the gas fully depressed to launch the car.

## N2MB Racing Limited Warranty

N2MB Racing warrants that all of its products are free from defects in material and workmanship for a period of 1 year from the date of purchase. If an N2MB product is found to be defective within this period, N2MB Racing will repair or replace the product. The choice between these two methods of remedy is made at the sole discretion of N2MB Racing. This shall constitute the sole remedy of the purchaser and the sole liability of N2MB Racing to the extent permitted by law. This warranty is exclusive and in lieu of all other warranties or representations whether expressed or implied. This warranty is limited to the repair or replacement of the N2MB Racing product, and shall never exceed the purchase price of the N2MB Racing product. N2MB shall not be responsible for special or consequential damage or costs incurred as a result of the failure or use of the N2MB Racing Product except as required by law. Unauthorized alteration or repair of N2MB Racing products will void this warranty if the alteration or repair is found to have caused the N2MB Racing product to fail. In the event that a product is warranted, the purchaser shall be responsible for any and all shipping costs.

N2MB Racing reserves the right to improve its products at any time and is at no time responsible for exchange or upgrade of products that were manufactured previously.
